

# Kasyno

## WINTER TRITICALE

**Kasyno is the highest yielding variety on the AHDB Descriptive List 2022/23. It is a short, stiff-strawed attractive variety and is early to mature, finishing well in the field. This combination of superb yields and excellent standing power make Kasyno suitable for all soil types to maximise performance. Kasyno has excellent resistance to yellow rust and a high specific weight.**

The performance of triticale in a second cereal situation has for many years been underestimated. Interest is now increasing on farm in this flexible, high yielding crop. Trial yields are up at 10 t/ha and second cereal yields on farm can compare favourably with other crops, including wheat.

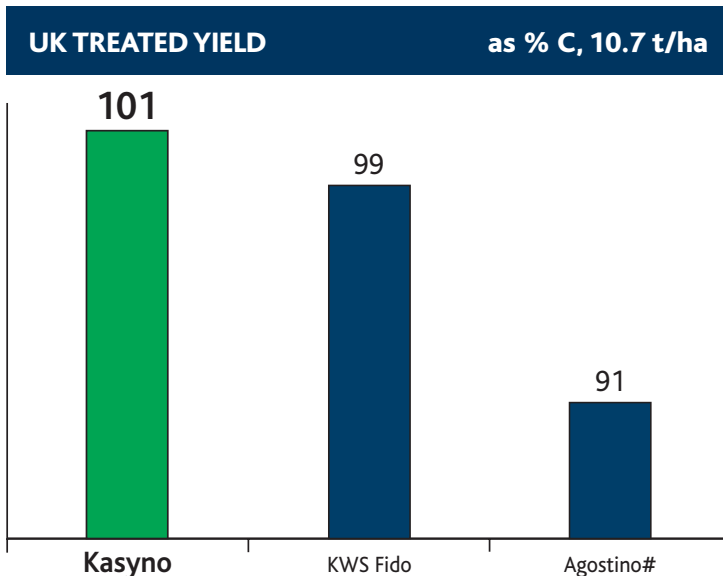

A principle market for triticale is for grain and for on farm feeding. Triticale has a new expanding market in anaerobic digestion, where its low costs, ease of management and dry matter yields are proving attractive. Senova's leading varieties are proving popular for AD plants.

Triticale is also well suited for bioethanol production, with its inherently high fermentable carbohydrates and soluble proteins. In addition, triticale is very productive in NVZs and under lower input systems.

• Superb yields

• Short, stiff straw

• Good specific weight

### GRAIN QUALITY

Specific weight (kg/hl)	73.1
Protein content %	11.9

### AGRONOMICS

Lodging %	[0]
Straw length (cm)	101
Ripening (days ± Agostino)	[+1]

### DISEASE RESISTANCE

Yellow rust*	8
